

Every forward pair of the Tülu-3 ladder: how much of the context→answer map survives median over 7 non-degenerate corpora, every corpus overplotted

- identity+bias of the CONTEXT alignment map (t6's remap)
- identity+bias of the ANSWER alignment map (t7's remap)
- shuffled-pairing null, per tier (t0/t6 drawn; t7/t8 = -0.0008 $\approx$ the zero line)
- 0: direct transfer
- 6: reparam contexts
- 7: reparam answers
- 8: reparam both
- cross: source ctx $\rightarrow$ target answer (fresh fit)
- within-model ceiling (target's own map)
