

# Context→answer map scaling on LMSYS contexts (issue #779, fair-fitter comparison)

## No plateau: still rising at the largest n tested

## Returns decay slowly — still +0.028 at the top

Source: eval\_results/issue\_779/fitter-fair-comparison/scaling\_curves.json (anchor layer 19, last-input-token variant, 3 draws per  $n$ ; error bars = population sd).

Ridge lambda railed at the grid maximum (1000) at EVERY  $n$  including 3600 — the fit is still regularisation-limited across the whole measured range.
