

Redundancy among the 24 Shapley blocks (rank space, n=113,260)

First canonical correlation between block column sets— reduces to |Spearman| for single-column blocks, handles the multi-column judged-axis dummies natively. Complete linkage on (1 - corr), matching the production clustering. Cells ≥ 0.50 annotated.

These 24 blocks are ALREADY the output of declustering at 0.90, so by construction no pair can exceed the orange line— the figure shows how CLOSE they come. Exactly one pair (consistency / mean_act_cond, 0.851) merges at the dotted-blue 0.85 cut, taking 24 blocks to 23.
