

Average across behaviours (five-method figure): effect of excluding spread-failed cells

average across behaviours — all cells included

Averaged-across-behaviours panel of the five-method Result 2 figure (older result2_methods protocol), both ways. LEFT: spread-failed cells excluded (as in the main figure) — evil drops out of generic chat and completely OOD (its wildchat + both OOD rungs fail the Result 1 spread gate), so those bars average sycophancy + hallucination only (2 behaviours; the other groups average 3). RIGHT: all cells included — generic chat and completely OOD then carry evil's near-floor uninterpretable cells and are hatched/muted accordingly. Same metric, arms, CI convention, and per-cell n as the main figure (see its caption).
