

#474 localized arm, epoch 1: residual-stream cosine predicts marker transfer where output-distribution JS fails
240 ordered transformation pairs, on-policy non-saturated regime. JS predicts transfer overall but only via the 3 stylized personas (red); drop them and it goes null. Cosine similarity (layer 21) predicts transfer among the 156 non-stylized pairs too, and predicts the trained log-prob directly at rho=+0.65 (not the base prior).
