

On-policy: Revised reads ~4 nat higher than Legacy at every context (install/read-slot strength, not behavioral emission)
300 own-generations per cell, marker log-prob read at the canonical end-of-own-response slot via teacher-forcing. Source = software-engineer persona, seed 42. Emission_rate = 0/300 for BOTH rigs across all 30 contexts — the model does NOT actually emit the marker on-policy. This figure is install/read-slot strength, NOT behavioral leakage. Phase 4 is otherwise blocked by a vLLM 0.11 + rsLoRA crash; this single cell is the named scope limitation.
