

Is output-ness a continuous property or a binary one?

TOP ROW: full-dictionary density of each continuous measure — needs no R^2 , so these verdicts are DEFINITIVE. BOTTOM ROW: median R^2 per decile — PROVISIONAL TARGET — #1738 SAE->SAE context arm. The correct target (full-width dense->SAE, task #7) does not exist yet. The two arms rank features at $\rho = 0.933$ at panel width, so SHAPE conclusions survive the swap; LEVELS do not.

dashed vertical = the q0.90 cut the binary promoting/suppressing class uses; dotted verticals = detected KDE modes. A unimodal density with the cut inside the bulk means the binary class is a slice off a continuum, not a natural kind.
