

Exact Shapley share by block, within activity deciles

113,262 features, full dictionary; collinearity collapsed at $|\rho| \geq 0.9$ (complete linkage) | REAL TARGET - dense context to SAE feature map, ridge__mean arm (#1482 single-turn corpus, 121,111 scored; covariates same corpus)

The firing-frequency block IS the stratifying variable: within an activity decile its variance is restricted BY CONSTRUCTION and its share is mechanically suppressed.
Do NOT read 'activity contributes nothing within deciles' as a finding.

x = axis suppressed (a class below the 30-feature floor). Flagged axes carry globally rare classes: side_class carries '2' (261 pooled); speaker_property carries 'unclear' (22 pooled).
Deciles are equal-COUNT, not equal-width in log-activity — d1 (42.0x) and d10 (8.6x) are the least tightly conditioned columns. Uncertainty is split-half, not bootstrap.
