

Persona-vector extraction regimes, whitened space (primary) vs raw space (deprecated)

Filled bars are the whitened reads — the space the fitted map and the main grid actually live in. Dotted outlines are the superseded raw-space reads, which applied a whitened-fit map to un-whitened activations. Only out-of-sample rungs are shown; the frozen layer is picked by $\max |\rho|$ on the train rung, so the sign is not pinned by selection.
