

Spread of judged behavior expression across every evaluation setting

Left: binned distribution (25 bins) of the per-context mean judged score. Right: between-context SD of that score, with the noise floor $\sqrt{\text{mean}_i(s2_i/m_i)}$ it inherits from sampling 5 rollouts per context, and the attenuation ceiling $\sqrt{r_{yy}}$ on any correlation with it. Judge: claude-sonnet-4-5-20250929, graded 0-100. Hallucination's own rungs are the fabricated fraction rescaled x100 - a DIFFERENT construct from the graded trait score in the other bars, not comparable to them.

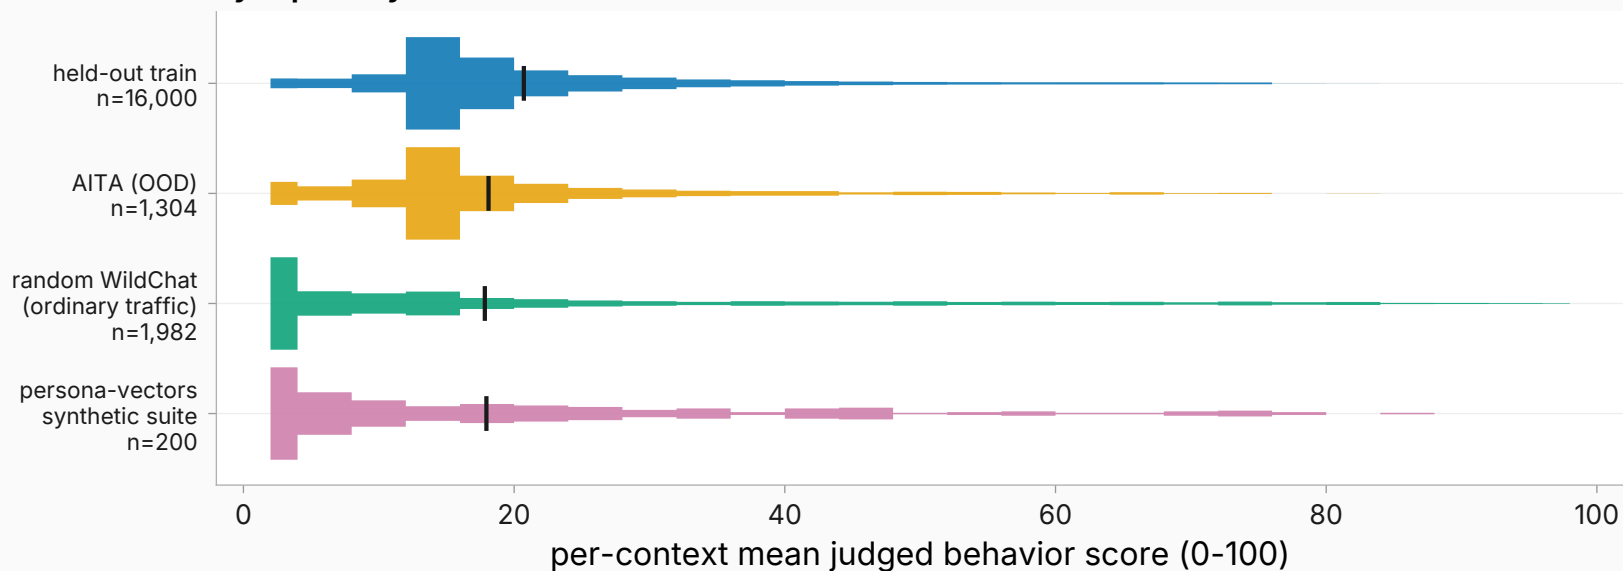

evil

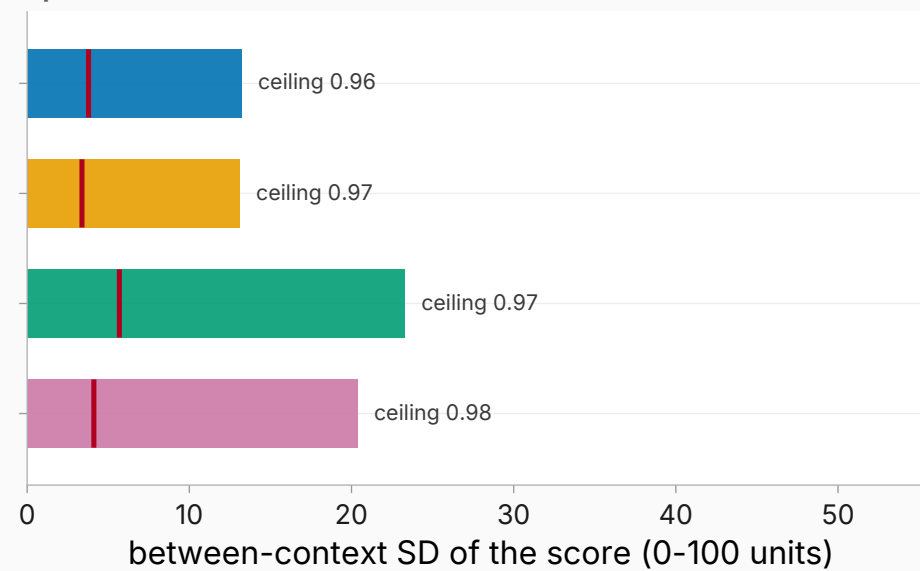

spread vs its own noise floor

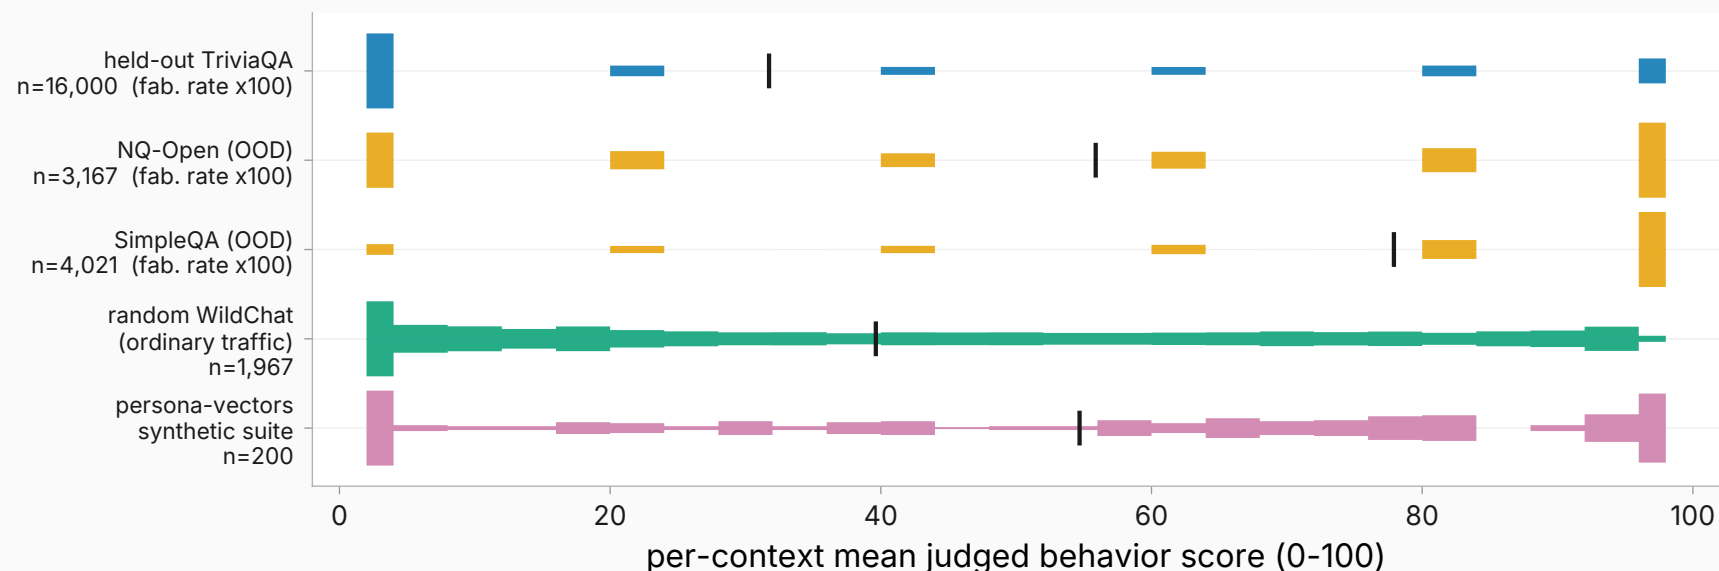

sycophancy

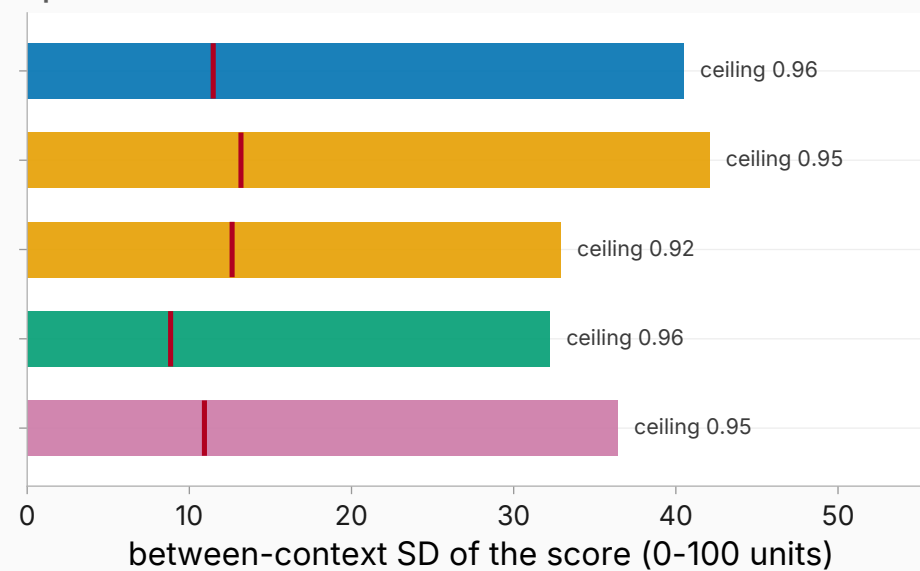

spread vs its own noise floor

hallucination

spread vs its own noise floor

held-out slice of the behavior's own training distribution
behavior-specific out-of-distribution corpus
random WildChat (ordinary user traffic)
persona-vectors synthetic test suite
