

Context→answer map scaling: plateaus by ~50k, and nonlinearity only pays at scale

Circles = #779 D2 fair-fitter comparison (exact fits, 3 draws/ $n$ ). Diamonds = #779 n1M round (mixed\_1m; 50k point is the exact-KRR Nyström gate slice).

Rounds differ in fitter implementation and  $\lambda$  grid (D2  $\lambda \leq 1e3$  and railed at that max; n1M  $\lambda$  grid  $1e-3 \dots 1e8$ , selected  $\lambda = 1e-3$  at the low edge), so the 3,600→50,000 segment mixes rounds and is indicative, not a controlled within-round contrast.
