

Role-vs-system paired gap at $r=16/\alpha=32$, per persona x contrast, vs the prior $r=32$ run

System-arm marker log-probability minus role-header log-probability at the wrong-persona probe, paired per seed. Negative = role leaks MORE than system. Errorbars = 95% bootstrap CI over 5 seeds. Dotted = prior $r=32/\alpha=64$ run (same $\text{lr}=5\text{e-}6$), means only.
