

Does the early-vs-late equivalence hold across layers?

Shaded band = registered ± 0.03 equivalence margin; 95% bootstrap CIs

H1 contrast: first-16 gap minus last-16 gap
(own vs external plain)

Does the prefix closure replicate across layers?

Shaded band = below the registered 0.02 margin; matched survivors, identical target

Matched $\Delta G(0 \rightarrow 16)$: own-advantage closed
by absorbing 16 prefix tokens
