

# Which continuous feature properties track how well the context-to-answer map predicts a feature?

114,980 SAE features (BatchTopK k=64, resid\_post layer 19) | held-out  $R^2$  from RIDGE fits only — no nonlinear arm exists at this width |  $R^2$  display-clipped at -1 |  $R^2$  is the #1738 multi-turn corpus context arm; covariates are #1482 single-turn

decile-median trend line overlaid; log-count hexbin density; Spearman  $\rho$  annotated per panel. Linear-axis panels view-clip x to [0.5, 99.5] percentile — display only; every  $\rho$  and decile median uses the full unclipped data.
