

# #560 space agreement: divergence from the identity localizes saturation

marker log-prob change  $\Delta \log P(\ast)$ , trained - base (nats)

- never a training negative (512 cells)
- training negative under the other adapters (45 cells)
- source-resident positive control (3 cells)
- $\Delta \log P = \Delta z$  (no saturation)

marker-logit push  $\Delta z(\ast)$ , trained - base (logits)
