

Role-vs-system paired gap at $r=16/\alpha=32$, per persona x contrast, vs #533's $r=32$ ghost

$d = \log P(\text{system_arm}) - \log P(\text{role})$ at the wrong-persona probe, paired per seed. Negative d = role leaks MORE than system. Errorbars = 95% bootstrap CI over 5 seeds. Dotted = parent #533 at $r=32/\alpha=64$ (same $\text{lr}=5\text{e-}6$), means only.
