

On fact, the bake-off underperforms the coarse predictors and collapses under the prior control

The search-best cell drops from $|\text{corr}|=0.67$ to $|\text{corr}|=0.03$ once the bystander's own prior on the fact is partialled out.

Smoke-mode estimate (no attenuation correction). Coarse predictors (bars 1-5) computed on the same n=18 cells as the search-best (bar 7). Bar 6 (planned anchor) sits on n=25; the others on n=18.
