

Fair recompare: existing within-corpus vs battery-held-out (novel-question) Pearson r

Battery = 2,400 fixed eval rows, questions disjoint from the query bank; battery prefixes 0-overlap with the non-battery training prefixes, so double-held-out COINCIDES with novel-question (prefix-familiarity $\Delta = 0$). within→battery drop = query-familiarity inflation. Map+r_B arms are matmul re-scores (no refit); probes are refit on the non-battery pool. Banked within-corpus leaks (battery rows were in its train+CV pool).
