

Role-vs-system paired-d trajectory over the sub-1-epoch training-amount grid

$d = \log P(\text{system encoding}) - \log P(\text{role encoding})$ at the wrong-persona teacher-forced probe, paired per seed. Points = implant-active grid points (both arms own-emit ≥ 0.5 ; 95% bootstrap CI over 5 seeds). Shaded region = implant never installed (no read). Dotted squares = the parent epoch grid at 37.5 steps/epoch equivalents.
