

Which feature properties track how well the dense context state predicts an SAE answer feature?

dense context state (3,584-d) -> SAE answer features, 16,089 panel features (BatchTopK k=64, layer 19) | ridge median R^2 +0.177 (99% positive) vs MLP -0.028 (46%) | target and covariates BOTH #1482 single-turn — no cross-corpus join

hexbin + solid trend = RIDGE; dashed trend = MLP (both panel-grain, 16,089 features). R^2 display-clipped at -1; linear-axis panels view-clip x to [0.5, 99.5] pct — display only, all statistics unclipped. Bracketed tag = predictor group.
