

Early layers carry the signal; layer 22 does not

thick = resample 24 bystander personas · thin = resample 6 sources · B=5000, 95% CIs

Paired test: every gap excludes zero

95% CI of the $|\rho|$ difference, same draws applied to both cells

Summary: persona-distance metrics at early layers predict sycophancy leakage (CIs clear of zero under both resampling axes); the same metrics at layer 22, where marker leakage was best predicted, do not. Paired tests on shared draws separate even the top two cells.

● bystander-resampled CI ■ source-resampled CI — early-layer cells — late-layer (L22) cells
