

Wrong-slot dose response at LoRA $r=16/\alpha=32$ ($lr=5e-6$) vs the prior $r=32/\alpha=64$ run

Marker log-probability under the wrong persona's encoding. Lower = less leakage. Solid = this run at $r=16/\alpha=32$, errorbars = 95% bootstrap CI over 5 seeds, $n=50$ questions each. Dotted = prior $r=32/\alpha=64$ run (same $lr=5e-6$), means only.
