

The real context-vector patch does not separate from the floor controls

f_CV = +0.023 = mean over (context, layer, scope) of [p_up - self_c0]; P↑ moves to the base-CV null, P↓ falls to the random/norm-matched floor — no input localization

patch effect on activation

(1 = moved to FT profile, 0 = at base)

base-CV null (00) trained-CV null (0+) random-CV floor
 trained-CV → base (real patch) base CV → trained (real patch) norm-matched floor
