

# #474 non-stylized cosine effect is a monotone gradient, not a vertical-line artifact (localized arm, ep1)

The linear similarity axis compresses the bulk (77% of non-stylized pairs above cos-sim 0.90), so the raw scatter looks vertical. Left: a log cosine-distance axis spreads the dense region and the trend is visible. Right: mean transfer rises monotonically across all five cosine-sim quintiles (12.2 → 18.2 nats), and the correlation holds inside the 0.94-1.0 cluster alone (rho +0.43).
