

Full dictionary: what survives adjusting for firing frequency?

114,980 SAE features, full dictionary (BatchTopK k=64, resid_post layer 19) | PROVISIONAL TARGET — #1738 SAE->SAE context arm. The correct target (full-width dense->SAE, task #7) does not exist yet. The two arms rank features at rho = 0.933 at panel width, so SHAPE conclusions survive the swap; LEVELS do not.

rows sorted by |partial rho|; percentile 95% CI over 2,000 bootstrap draws (ranks fixed at the full sample). SEE ALSO rho_by_activity_decile: several of these predictors show effect modification, where a single partial rho is not a valid summary.
